

Frontend UI Dashboard KPI Analysis Report

Project path: /home/user/Angular/R-SPACE-PRO

Generated at: 2026-08-08T12:43:59+05:30

Analysis type: Frontend and UI source analysis only. Backend records were not counted.

Routed dashboard: /main/dashboard uses DashBoardComponent

This PDF explains how Tasks, Releases, Issues, Tickets, and DSR submission status should be represented in the dashboard UI. It is based on Angular templates, components, routes, table columns, status labels, and existing dashboard bindings in the frontend workspace.

Executive Summary

- The active dashboard is src/app/features/admin/components/dash-board/dash-board.component.html, routed through AdminRoutingModule at path dashboard.
- The dashboard already presents KPI cards for projects, releases, tasks, issues, and staff, plus tables for overdue items, due today, upcoming releases, completed releases, tasks, and issues.
- Tickets and DSR submission compliance are available as separate UI screens, but they are not currently integrated into the routed dashboard KPI grid.
- Employee-wise, team-wise, and date-wise analytics are partially supported by frontend fields across task, issue, ticket, DSR, and team components, but no unified dashboard view model exists yet.
- Recommended dashboard additions are ticket KPI cards, DSR compliance cards, employee/team/date rollup tables, and chart panels for status, priority, release type, ticket product, and DSR missing employees.

Current Routed Dashboard UI

UI Area	Current Widgets	Frontend Binding
Top KPI cards	Active Projects, Total Releases, Internal ...	data.active_project, data.total_release, ...
Attention Needed	Overdue Items, Due Today	data.overdue_items, data.today_due
Achievements	Upcoming Releases, Released Projects	data.upcomming_release, data.completed_re...
Workload	Tasks, Issues	data.task_list, data.bug_list
Detail dialogs	Reusable Tabulator tables	openMatDialog(), OverdueComponent, Projec...

Current dashboard cards use compact clickable cards, icon indicators, and dialog drilldowns. This pattern should be kept for Tickets and DSR so the dashboard remains consistent.

Module UI Coverage

Module	Main Frontend Screen	Dashboard Status
Tasks	OverviewTaskComponent, TasksComponent, Ove...	Already shown as Open/Closed cards, overdue ...
Issues	IssuesComponent with task_type bug	Already shown as Open/Closed cards and issue...
Releases	OverviewReleasesComponent, ReleaseManagerC...	Already shown as total/internal/external pas...
Tickets	TicketInfoComponent with Raised Tickets, O...	Not shown on routed dashboard yet
DSR Submitted	TaskOverviewComponent	Not shown on routed dashboard yet
DSR Not Submitted	NotSendDsrComponent	Not shown on routed dashboard yet
Team	TeamComponent	Only Active Staff count shown; team KPI roll...

Recommended Dashboard Layout

- Top filter row: Date range, Employee, Team/Department, Project, Release Type, Ticket Status. Use the existing date-range-filter component pattern.
- KPI card row: Task Completion, Issue Resolution, Release Success, Ticket Closure, DSR Submission Rate, Missing DSR Employees.
- Operational card row: Open Tasks, Open Issues, Pending Releases, Pending Tickets, Overdue Items, Due Today.
- Charts row: Task/Issue Status Distribution, Release Type and Pass/Fail, Ticket Status by Product, DSR Submitted vs Missing.
- Tables row: Employee-wise KPI table, Team-wise KPI table, Date-wise trend table, Employees Not Submitted DSR table.
- Drilldown behavior: Reuse MatDialog and Tabulator table components so each KPI opens its matching detail rows.

KPI Card Definitions for UI

KPI Card	Formula for Frontend View Model	Recommended Drilldown
Task Completion Rate	closed_task / (active_task + closed_task) ...	Closed/open task rows
Issue Resolution Rate	closed_issue / (active_issue + closed_issu...	Closed/open issue rows
Release Success Rate	(internal_pass_release + external_pass_rel...	Passed/failed release list
Ticket Closure Rate	closed ticket status codes [4,6,7,10] / al...	TicketInfo overall tickets filtered ...
DSR Submission Rate	submitted employee-days / expected employe...	TaskOverview DSR rows and NotSendDsr...
Employees Not Submitted...	distinct employees in NotSendDsr rows for ...	NotSendDsrComponent table

Employee-Wise Dashboard Row

Create one row per employee for charts and tables. This row can power a leaderboard table, employee performance chart, and employee filter drilldown.

- employee_id, employee_name, team_name
- tasks_total, tasks_completed, tasks_pending, task_completion_rate_percent
- issues_total, issues_resolved, issues_pending, issue_resolution_rate_percent
-

- releases_total, releases_passed, releases_failed, release_success_rate_percent
- tickets_total, tickets_closed, tickets_pending, ticket_closure_rate_percent
- dsr_submitted_days, dsr_missing_days, dsr_submission_rate_percent
- worked_hours_total, average_completion_percent

Team-Wise Dashboard Row

Team grouping should use department_name first because TeamComponent already displays department_name. Fall back to department, manager, or project only when department_name is missing.

- team_name, employee_count
- tasks_total, issues_total, releases_total, tickets_total
- dsr_expected_employee_days, dsr_submitted_employee_days, dsr_missing_employee_days
- overall_completion_rate_percent, overdue_count, pending_count

Date-Wise Dashboard Row

Date-wise data should normalize all UI dates to YYYY-MM-DD, then feed line charts, daily bars, and heatmaps.

- date
- tasks_started, tasks_due, tasks_completed
- issues_created_or_due, issues_resolved
- releases_planned, releases_completed, releases_overdue
- tickets_created, tickets_closed
- dsr_submitted_count, dsr_missing_count, worked_hours_total

Tickets UI Dashboard Additions

Recommended Card/Chart	Frontend Source Fields	Placement
Total Tickets	tickets.length from TicketsComponent	Top KPI cards
Open Tickets	status 0	Top KPI cards
Pending Tickets	status 1,2,3	Top KPI cards or status chart
Closed Tickets	status 4,6,7,10	Top KPI cards
Failed/Rejected/Cancelled	status 5,8,9	Attention Needed
Ticket Product Split	product_name, type, version	Charts row
Ticket Owner Load	assigned_to_name, department_name	Employee/team table

DSR UI Dashboard Additions

Recommended Card/Table	Frontend Source Fields	Placement
DSR Submitted Today	TaskOverview rows by date and employee...	Top KPI cards
DSR Not Submitted	NotSendDsr date and employee_name	Top KPI cards
Submission Rate	submitted employee-days / expected em...	Top KPI cards
Missing Employees List	NotSendDsr rows	Attention Needed
Employee DSR Trend	date, employee_name, worked_hours, co...	Date-wise chart/table
Worked Hours Total	worked_hours converted to decimal hours	Employee-wise table

Status and Completion Mapping

Entity	Completed	Pending	Failed/Blocked
Tasks	Closed, Completed, Approved, Pa...	Open, In-Progress, In-Review, Pla...	Delayed, Cancelled,...
Issues	Closed, Completed, Approved	Open, In-Progress, In-Review, To-...	Delayed, Rejected, ...
Releases	Pass	Upcoming-Release, On-Hold, Open, ...	Failed, Rejected
Tickets	4 Closed, 6 Approved, 7 Complet...	0 Open, 1 In-Progress, 2 To-be-Te...	5 Cancelled, 8 Reje...
DSR	Present/submitted row exists	Expected but not submitted	Absent/missing DSR

Frontend Implementation Notes

- Keep DashboardComponent as the main dashboard target because it is the routed component for /main/dashboard.
- Add a DashboardViewModel in DashboardComponent that derives card values and chart rows from the data object plus ticket and DSR screen data.
- Reuse app-overdue for task/issue/ticket attention tables where fields match or create a generic KPI detail table for mixed entities.
- Reuse app-project-status-report for release drilldowns and keep release-specific columns there.
- Add ticket and DSR fetch calls only in the dashboard component or a frontend facade service; avoid scattering calculations inside templates.
- Use null or dash states for unavailable metrics; do not display 0 unless the frontend received a real empty row set.
- Provide no-data states for every chart panel so dashboard layout stays stable when filters return empty lists.

Suggested Dashboard View Model

- interface DashboardKpiVm { cards: KpiCard[]; employeeRows: EmployeeKpiRow[]; teamRows: TeamKpiRow[]; dateRows: DateKpiRow[]; statusCharts: ChartSeries[]; attentionRows: AttentionRow[]; missingDsrRows: MissingDsrRow[]; }
- interface KpiCard { id: string; label: string; value: number | string | null; rate?: number | null; icon: string; tone: string; drilldownKey: string; }
- interface MissingDsrRow { date: string; employee_name: string; team_name?: string; reason?: string; }
- interface DateKpiRow { date: string; tasks_due: number; issues_due: number; tickets_created: number; releases_planned: number; dsr_submitted_count: number; dsr_missing_count: number; }

Final Recommendation

The dashboard should become the single KPI command center by keeping the current card and drilldown pattern, then adding Tickets and DSR compliance beside Tasks, Issues, and Releases. The best next frontend step is to define a DashboardKpiVm, map current dashboard data into it, add ticket and DSR panels, then render employee-wise, team-wise, and date-wise tables/charts from the same normalized view model.
